

## 104 - External identity providers

Когато искаме да предоставим възможност на потребителя да се впише чрез външна платформа:

### External Identity Providers

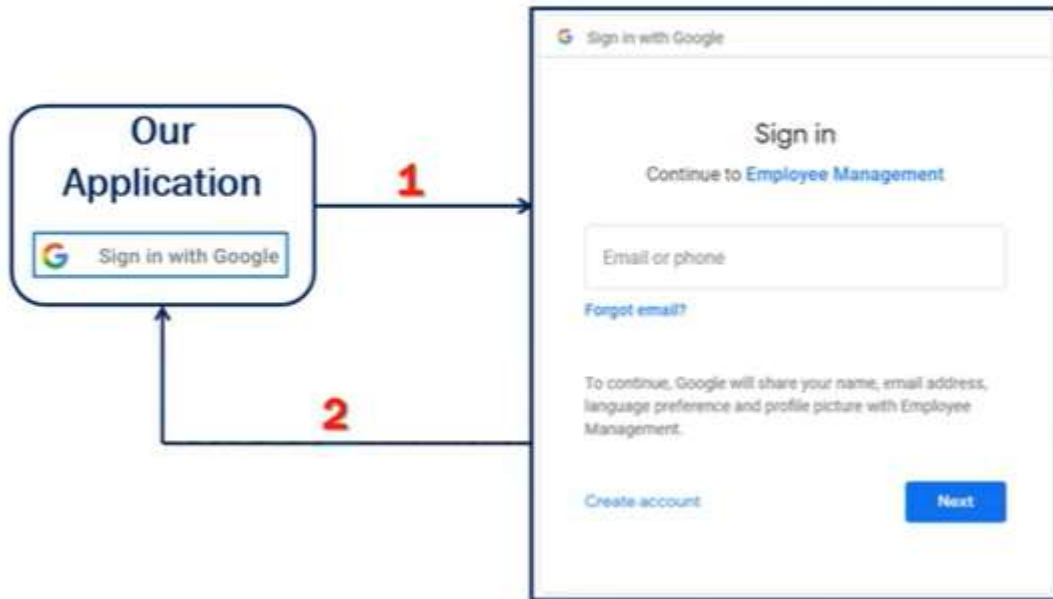

Най-важното е да се предостави възможност само за Trusted external identity providers + 1 потребител да няма по много различни акаунти от различни платформи, а той да бъде асоцииран с неговите различни към същия потребителски акаунт в нашето приложение.

## How External Identity Providers Work

A login form with a white background and a thin blue border. It is divided into two main sections. The left section is titled 'Log in' and 'Use a local account to log in.' It contains input fields for 'Email' and 'Password', a 'Remember me?' checkbox, and a blue 'Log in' button. The right section is titled 'Use another service to log in.' and contains three blue buttons labeled 'Google', 'Microsoft', and 'Facebook'. A mouse cursor is pointing at the 'Microsoft' button.

Our application then redirects the user to Google signin page. Here the user provides his/her google login credentials. Upon a successful login, google will then send the user back to our application and a pre-configured callback function is executed. The code in this callback function checks the identity received from the external identity provider and sign-in that user into our application.

# How External Identity Providers Work

To use an external identity provider like **Google**, we have to first register our application with Google. Upon successful registration we will be provided with **Client Id** and **Client Secret** which we need to use Google authentication.
