

66 - Register new user

ASP.NET Core Identity - User Registration

A screenshot of a web application's user registration page. At the top, there's a dark header bar with a small icon and the text 'List Create'. Below this, the title 'User Registration' is displayed in a large, bold font. The form contains three input fields: 'Email', 'Password', and 'Confirm password'. Each field has a corresponding label above it. At the bottom left of the form, there is a blue button labeled 'Register'.

Първо ни е необходим ViewModel class, който да достави данните от

UserRegistration view -> Controller

ViewModels folder -> Add -> New Item -> Class -> RegisterViewModel.cs

```
namespace EmployeeManagement.ViewModels
{
    0 references
    public class RegisterViewModel
    {
        [Required] validation attribute
        [EmailAddress]
        0 references
        public string Email { get; set; }

        [Required]
        [DataType(DataType.Password)] to mask the characters
        0 references
        public string Password { get; set; }

        [DataType(DataType.Password)]
        [Display(Name = "Confirm password")] to separate 2 words Confirm_password
        [Compare("Password", ErrorMessage = "Password and confirmation password do not match.")]
        0 references
        public string ConfirmPassword { get; set; }
    }
}
```

```
using System.ComponentModel.DataAnnotations;
```

```
using System.ComponentModel.DataAnnotations;
```

```

namespace EmployeeManagement.ViewModels
{
    public class RegisterViewModel
    {
        [Required]
        [EmailAddress]
        public string Email { get; set; }

        [Required]
        [DataType(DataType.Password)]
        public string Password { get; set; }

        [DataType(DataType.Password)]
        [Display(Name = "Confirm password")]
        [Compare("Password",
            ErrorMessage = "Password and confirmation password do not match.")]
        public string ConfirmPassword { get; set; }
    }
}

```

Папка Controllers -> Add -> New item -> Controller class -> AccountController.cs

Или Add-> Controller -> MVC Controller

```

using Microsoft.AspNetCore.Mvc;

namespace EmployeeManagement.Controllers
{
    public class AccountController : Controller
    {
        [HttpGet]
        public IActionResult Register()
        {
            return View();
        }
    }
}

```

В папка Views -> нова папка Account -> razor view Register.cshtml

Направихме ViewModel, Controller, сега View:

Най-важно е да извикаме модела с клас RegisterViewModel, за да може да работим с дефинираните в него email, password, ConfirmPassword:

```
.cs Register.cshtml Program.cs RegisterViewModel.cs HomeController.cs
@model RegisterViewModel

@{
    ViewBag.Title = "User Registration";
}

<h1>User Registration</h1>

<div class="row">
    <div class="col-md-12">
        <form method="post">
            <div asp-validation-summary="All" class="text-danger"></div>
            <div class="form-group">
                <label asp-for="Email"></label>
                <input asp-for="Email" class="form-control" />
                <span asp-validation-for="Email" class="text-danger"></span>
            </div>
            <div class="form-group">
                <label asp-for="Password"></label>
                <input asp-for="Password" class="form-control" />
                <span asp-validation-for="Password" class="text-danger"></span>
            </div>
            <div class="form-group">
                <label asp-for="ConfirmPassword"></label>
                <input asp-for="ConfirmPassword" class="form-control" />
                <span asp-validation-for="ConfirmPassword" class="text-danger"></span>
            </div>
            <button type="submit" class="btn btn-primary">Register</button>
        </form>
    </div>
</div>
```

@model RegisterViewModel

```
@{
    ViewBag.Title = "User Registration";
}
```

<h1>User Registration</h1>

```
<div class="row">
    <div class="col-md-12">
        <form method="post">
            <div asp-validation-summary="All" class="text-danger"></div>
            <div class="form-group">
                <label asp-for="Email"></label>
                <input asp-for="Email" class="form-control" />
                <span asp-validation-for="Email" class="text-danger"></span>
            </div>
            <div class="form-group">
                <label asp-for="Password"></label>
                <input asp-for="Password" class="form-control" />
                <span asp-validation-for="Password" class="text-danger"></span>
            </div>
            <div class="form-group">
                <label asp-for="ConfirmPassword"></label>
                <input asp-for="ConfirmPassword" class="form-control" />
            </div>
        </form>
    </div>
</div>
```

```

        <span asp-validation-for="ConfirmPassword" class="text-
danger"></span>
    </div>
    <button type="submit" class="btn btn-primary">Register</button>
</form>
</div>
</div>

```

Остава да добавим линк Register в заглавното меню:

```

<li class="nav-item">
    <a class="nav-link text-light" asp-area="" asp-controller="home" asp-action="index">List</a>
</li>
<li class="nav-item">
    <a class="nav-link text-light" asp-area="" asp-controller="home" asp-action="create">Create</a>
</li>
<li class="nav-item">
    <a class="nav-link text-light" asp-area="" asp-controller="account" asp-action="register">Register</a>
</li>

```

За да преместим елемент Register вдясно, използваме `ml-auto`

```

<ul class="navbar-nav ml-auto">
    <li class="nav-item">
        <a class="nav-link text-light" asp-area="" asp-controller="account" asp-
action="register">Register</a>
    </li>
</ul>

```

User Registration

Email

Password

Confirm password

Register

Когато натиснем бутон Register, отваря Not found, защото сме декорирали само с [HttpGet], но все още нямаме post. Ако нямаше дори Get, нямаше да се случва нищо при натискане на бутона. Следва обработка на post в следващото видео.
